

# Instant Alerting Suite

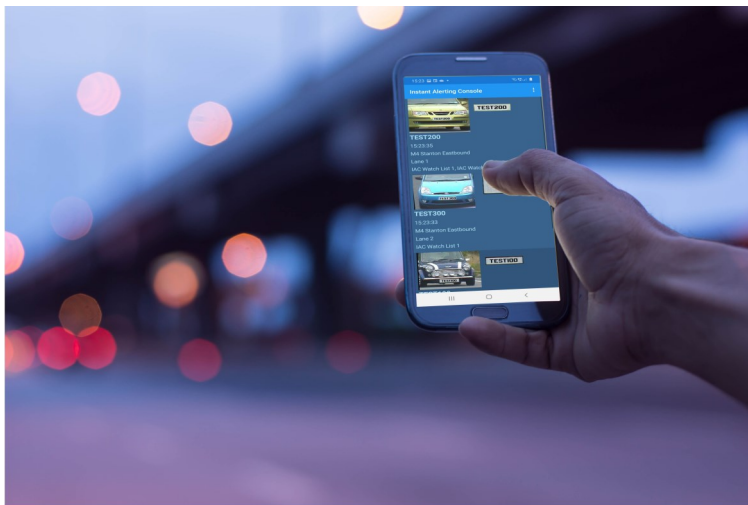

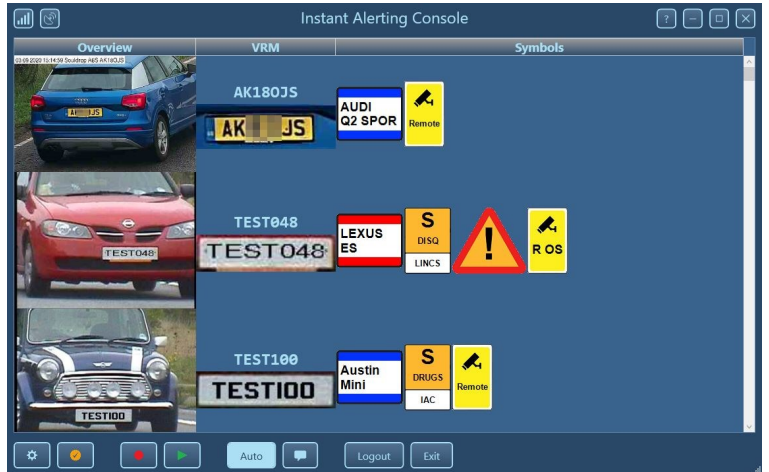

Receive ANPR alerts from your ANPR Management Server, direct to your mobile assets

## Instant Alerting Console

To further enhance the ANPR capability of our customers, QRO have introduced a product called Instant Alerting Console (IAC) that can receive alerts in a mobile unit, directly from fixed camera sites via the forces QRO ANPR Management Server.

Using geofences, if a mobile unit is within a pre defined distance from a fixed ANPR camera, it will receive the alert from that fixed site camera, on the IAC software installed on their in vehicle PC or tablet.

The software front end has been designed to meet the latest Regulation 109 compliance allowing single crewed vehicles to continue operation whilst driving.

## Instant Alerting Console Android (IAC Android)

This provides enhanced reactive capabilities to the force as the alerting platform is no longer limited to an in-car ANPR PC, but extends the alerts directly to the officer, whether in a vehicle or patrolling by foot.

The IAC Android also includes a rapid mapping feature which quickly provides the officer with a graphical representation of the camera site that generated the alert, allowing the officer to calculate their position in relation to this alert.

IAC android works in conjunction with the QRO ANPR Management Server to further enhance the forces response capabilities.

### Key features:

- Geofence
- Regulation 109 Integration
- Central ANPR Management Server Deployment
- Multiple Receiving Devices
- Android Support
